QUMANITY

A Governance Protocol for Transparent Civilization

Implemented Foundation and Design Goals — for India and the World

Author	Rohit Mudgal (Founder, Qumanity)
Date	November 2026
Version	4.0 (revision of v3.0, June 2026)
Website	https://qumanity.in
Repository	github.com/sitaram-box/qumanity-web
Licence	GNU Affero General Public License v3.0 (AGPL-3.0)
Email	founder@qumanity.in
Classification	Public

Technical documentation is maintained in the repository (`docs/ARCHITECTURE.md`, `docs/API.md`, `docs/DATA_MODEL.md`, `docs/HANDOVER.md`*).*

Revision note. Version 3.0 described several planned capabilities in the present tense. This revision separates what is built from what is designed. Every capability is marked with one of four statuses:

- **[IMPLEMENTED]** — working in the live system today.
- **[PILOT]** — working, but run in a single village and not yet generally available.
- **[IN DEVELOPMENT]** — being built.
- **[PLANNED]** / **[DESIGN GOAL]** — designed, described and intended, but not yet built.

ABSTRACT

Human civilization stands at a critical juncture. Despite unprecedented technological and material progress, governance systems at every level, from villages to nations, remain plagued by corruption, opacity, inequality, ecological destruction, and the manipulation of democratic processes. These failures are not accidental; they are structural consequences of centralized, unaccountable power.

This white paper introduces Qumanity, a governance protocol and civic platform designed to address these systemic failures by embedding transparency, accountability, and participatory decision-making into the architecture of governance itself. It draws conceptual inspiration from Vedic principles of nested self-governance and from the idea of interconnectedness found in quantum science. It uses no quantum technology; the name is shorthand for Quantum + Humanity.

The platform organizes civic life into four timelines — Private, Personal, Public, and Global **[IMPLEMENTED]** — that allow individual reflection to escalate into collective action. A nested governance structure (Village → Tehsil → District → State → Zone → Country → Continent → Earth) ensures that decisions are made at the appropriate scale **[IMPLEMENTED as nested geography and Collective Boards at every level; elected councils exist only in a one-village pilot]**. Each member holds a dual identity: a Private ID anchored to birth location and an Account ID anchored to present location **[IMPLEMENTED]**. A transparent Karma ledger records verified positive actions **[IMPLEMENTED in part; see Section 4.5]**.

Today Qumanity is delivered as a public website (qumanity.in) offering registration, boards, a family tree, internal messaging, a map, and live statistics **[IMPLEMENTED]**, with a cross-platform mobile app **[IN DEVELOPMENT]**. The wider ecosystem — village kiosks, biometric authentication, offline-first operation, a Planetary Ledger Node Network (PLNN), marketplace, justice, health and education modules, and a voice interface — is the project's **design goal** and is not yet built.

The system is built with Flask and SQLite and is open-source (AGPL-3.0) and auditable; any community can adopt and adapt it. This paper presents the philosophical foundations, the architecture as it exists, the implementation roadmap, and the future vision. It concludes with an invitation to collaborate.

Keywords: Governance, Participatory Democracy, Karma, Transparency, Civic Technology, Open-Source, Vedic Philosophy, Digital Public Goods Standard, Qumanity, India

1. EXECUTIVE SUMMARY

The Governance Crisis and the Qumanity Solution

Across every scale of human organisation — from the individual to the planet — governance has failed structurally. Power is centralized. Decisions are opaque. Accountability is absent. Citizens vote once every few years and then wait in silence while public funds vanish, communities fracture, and ecosystems collapse. The crisis is not a lack of technology; it is a lack of transparent, participatory, self-correcting governance.

Qumanity (Quantum + Humanity) is a governance protocol — not another platform — developed by its founder. Its goal is to restore transparency, participation, and self-rule through shared public infrastructure: dual-key identities, nested community boards, a transparent record of ethical action, and, as a design goal, village kiosks.

Five ideas define the protocol:

1. **Four Timelines** (Private, Personal, Public, Global) that separate lifelong identity from present governance **[IMPLEMENTED]**.

2. **Nested Governance** from Village to Earth across eight levels **[IMPLEMENTED as geography and boards; councils are a one-village PILOT]**.
3. **Dual-Key Identity** — a birth-based Private ID and a location-based Account ID **[IMPLEMENTED]**.
4. **A Karma ledger** that records verified actions and is kept separate from money **[IMPLEMENTED in part]**.
5. **Zodiac-Based Elections** held in monthly cycles **[PILOT in one village]**.

Two interfaces serve citizens: a website for public transparency, registration and daily participation **[IMPLEMENTED]**, and a cross-platform mobile app that uses the same backend **[IN DEVELOPMENT]**. A distributed Planetary Ledger Node Network (PLNN) and offline-first village kiosks are the long-term infrastructure vision **[PLANNED]**.

Status. Qumanity is live at qumanity.in. Registration, nested geography covering more than 635,000 villages across 10 countries of the Indian sub-continent, the Karma ledger, Collective Boards, the Family Tree and a 13-language interface (English plus 12 Indian languages) are operational. A zodiac-cycle council election is being piloted in one village (Rohini Sector 24, Delhi). The mobile app, kiosks, biometrics, marketplace, justice module and national rollout are planned or in development.

> *"Vasudhaiva Kutumbakam" — The world is one family.*

Join us — as a citizen, developer, researcher, or partner — and help build governance infrastructure worthy of humanity.

2. INTRODUCTION

2.1 The Paradox of Progress

Humanity stands at an extraordinary threshold. We have mapped the genome, connected billions through digital networks, and sent instruments to the edge of the solar system. Yet alongside this progress runs an equally unprecedented crisis: poverty persists beside abundance, wars rage beside calls for peace, and ecological systems collapse beside pledges of sustainability.

We are more connected than ever — and more disempowered. The digital revolution promised democratisation. It delivered concentration: a handful of platforms now mediate how citizens speak, shop, learn, and even vote. Governance feedback loops that once operated through village assemblies now operate through algorithms no citizen can audit.

2.2 Structural Failure of Existing Governance

Today's dominant models share three structural defects:

- **Centralization of Power:** Decisions that affect a village are made in distant capitals and corporate headquarters. Citizens become subjects of systems they cannot see, let alone shape.
- **Opacity:** Public budgets are published as documents no one reads. Procurement happens behind closed doors. Trust erodes not because people are cynical, but because verification is impossible.
- **Disconnection:** Raise a grievance today; receive a reply in months — if ever. Elections occur every few years; communities live every day. The temporal mismatch between governance and life is the silence in which corruption grows.

2.3 The Need for a New Paradigm

The design principles Qumanity sets itself:

Principle	Description
Decentralized	Power nested locally, from the village upward.
Transparent	Actions recorded and visible to the community they affect.
Participatory	Continuous engagement, not episodic elections.
Self-Correcting	Communities vote, escalate, and rotate leadership.
Temporal	Governance rhythms aligned with natural cycles, not political convenience.

India has been the cradle of Dharma, Karma, and Democracy for millennia. The gram sabha predates the nation-state. The concept of Rta — cosmic and social order maintained through righteous conduct — predates the algorithm.

2.4 Introducing Qumanity

Qumanity draws on Vedic wisdom and on the idea, from quantum science, that reality is relational. From Vedic tradition it takes nested self-governance, the accountability of Karma, the life stages of Ashrama, and the cosmic order of Rta. From quantum science it takes only a *metaphor* — that every action is connected to every other. The name reflects an organizing idea: a transparent, nested record of people, time, and place. It is not a claim about quantum computing, and the system does not use quantum computing, quantum cryptography, or any quantum hardware.

Qumanity is intended as a protocol, not a platform. Like the Internet Protocol defines how data moves without owning the networks, Qumanity aims to define how citizens govern and account for ethical action — without owning the communities that adopt it.

> *"Qumanity is not a product. It is a promise — that technology can serve humanity, not exploit it."*

3. THE GOVERNANCE CRISIS

3.1 Individual Level

At the individual level, citizens lack a persistent voice. Between elections — often years apart — there is no formal channel to raise concerns, track outcomes, or hold representatives accountable. Poverty is reinforced by digital exclusion: those without smartphones, literacy, or connectivity are locked out of the services that increasingly define civic life.

Community service — teaching children, planting trees, caring for elders — goes unrecognised because no ledger records it. The individual is connected to the world through a screen, yet disconnected from the decisions that shape their daily existence.

3.2 Local Level

At the village and town level, corruption thrives where transparency is absent. Public funds are difficult to track. Middlemen intercept resources intended for the poorest. Communities fracture along caste, party, and family lines — partly because no shared system aligns incentives around collective welfare.

Environmental degradation accelerates when local stewardship is disconnected from local governance. Rivers are polluted, forests cleared, and commons depleted — with no accountable ledger linking action to consequence.

3.3 National Level

At the national level, electoral cycles are too infrequent to reflect ongoing community needs. Stolen elections, voter manipulation, and media distortion erode the foundation of representative democracy. Inequality widens in both income and voice — the wealthy access power; the poor access none.

Even when elections are free, governance between elections is not. Trust in institutions erodes because institutions demonstrate accountability only during campaigns.

3.4 Global Level

At the global level, war persists across regions with no planetary mechanism for transparent resolution. Climate change accelerates while data remains fragmented across agencies that do not share a common ledger. Biodiversity loss proceeds unchecked. International institutions issue commitments that no village can verify and no citizen can enforce.

Surveillance capitalism treats eight billion humans as data products — profiled, targeted, and monetised without consent.

3.5 Root Cause

Across every scale, the root cause is identical: **opaque, centralized, unaccountable governance.**

3.6 The Cost

The cost of this failure is measured in human suffering (poverty, displacement, violence), ecological collapse (climate disruption, species extinction, resource depletion), and social fragmentation (polarisation, distrust, the death of community). These are not separate crises. They are symptoms of a single structural failure — and they demand a structural response.

Sections 2 and 3 state the motivation for the design. They are not a claim that every existing platform is deficient, and not a claim that Qumanity has solved these problems at scale. It has not.

4. THE QUMANITY SOLUTION

4.1 Core Principles

Principle	Meaning	Status
Decentralization	Governance nested from village to planet; power and value remain local	Nested structure **[IMPLEMENTED]**; distributed infrastructure **[PLANNED]**
Transparency	Community decisions are recorded where the affected community can see them	Boards, posts and scores **[IMPLEMENTED]**; a public ledger of every vote and transaction **[DESIGN GOAL]**
Participation	Continuous engagement through posts, elections, karma, and collective boards	**[IMPLEMENTED]**; elections **[PILOT]**
Self-Correction	Community scores determine escalation; failed posts archive; councils rotate monthly	Escalation and archive **[IMPLEMENTED]**; rotation **[PILOT]**

4.2 Four Timelines: Private → Personal → Public → Global [IMPLEMENTED]

Every citizen navigates four distinct timelines — accounts that separate identity, relationships, governance, and planetary consciousness:

Timeline	Anchored To	Purpose (today)	Purpose (design goal)
Private	Birth location	Lifelong identity, Qoin wallet, messages, personal history	—
Personal	Family and social circle	Relationships, family tree, social connections	—
Public	Present location	Village board, council elections (pilot), council address	Marketplace, justice, health and education services
Global	Earth → Continent → Country	Planetary statistics, global collective board	—

Birth identity is immutable; governance rights are anchored to where one lives. A citizen who migrates carries their Private timeline forever but joins a new Public timeline at their destination. The Public timeline is currently active in 10 countries of the Indian sub-continent; members elsewhere join through a Global Account, which has the Private, Personal and Global timelines.

4.3 Nested Governance: Village → Earth

Qumanity organises society into eight nested levels:

Village → Tehsil → District → State → Zone → Country → Continent → Earth

Every member, discussion, and governance mechanism is scoped to one of these levels.

Collective Boards [IMPLEMENTED]. Each level has a Collective Board where residents post and vote. Concerns that earn positive support escalate through the levels — a village issue that resonates nationally can ascend toward the planet, validated by community votes at each stage. Concerns that fail to earn support are archived. The system aims to self-correct without censorship.

Quantum Punch (Q-Punch) Councils [PILOT; remainder DESIGN GOAL]. Q-Punch is Qumanity's council-addressing and participatory-governance mechanism: the means by which a location, not just an individual member, can be written to and represented. The design gives each level a council with five leadership roles:

Role	Function	Status
Nayak	Male elected leader	**[PILOT]**, one village
Nayika	Female elected leader	**[PILOT]**, one village
Mentor	Ethical guidance for the council	**[DESIGN GOAL]**
Manager	Day-to-day operational administration	**[DESIGN GOAL]**
Agent	Kiosk operator; assists citizens with access and literacy	**[DESIGN GOAL]** (depends on kiosks)

Implementation boundary. Only the Nayak and Nayika seats exist in the live system, and only at village level. A council address (a way to write to a location's council through Qmail) is reachable at village level only. Addresses for higher levels are created once a location's member count crosses that level's threshold, but they cannot yet receive messages, because no elected councils exist above the village. The vision is eight levels of participatory governance; the current implementation is one level, piloted in one location.

4.4 Dual-Key Identity [IMPLEMENTED]

Every member holds a Qumanity Identity (QID) with two keys:

Key	Basis	Changes?
Private ID (9 digits, with a 5-character PIN)	Birth location	Never — lifelong anchor of accountability

Key	Basis	Changes?
Account ID	Present location	Yes — updates, with council approval, when the member relocates

The Private ID ensures that karma, history, and accountability persist across a lifetime. The Account ID ensures that voting rights, council eligibility, and local board membership reflect where one actually resides. No email address is required to register. Identity is rooted in place, not in a corporate database.

Note: v3.0 called the second key the "Public ID". The product now calls it the Account ID.

4.5 Karma and Qoins

Qoins [IMPLEMENTED]. Qoins are a civic-service-earned unit recorded in each member's own wallet. They are minted through defined platform mechanics (such as registration and referral activity, and board posts that rise through the levels). They are not purchased, not traded on an open market, and not convertible to external currency in the current implementation. The platform does not sell them.

Karma [IMPLEMENTED in part]. Karma is a separate recognition and accountability score. It is **never money and is never converted to Qoins**; this separation is an explicit design decision. Each Karma entry is recorded individually; a member's total is always the sum of their entries, never an editable number.

Karma comes from two sources today:

- **Commercial:** star ratings (1–5) of a real local business, given by a member of the same village.
- **Non-commercial:** a village-level Collective Board post that freezes with a positive score.

A location also carries a **collective Karma** score, raised when a post that has risen beyond the village freezes positively. Individual Karma totals are shown on a member's own account and next to election candidates. In the election pilot, a minimum Karma score of 200 is a condition of candidacy (Section 4.6); neither Karma nor Qoins functions as a financial instrument or as voting weight.

Verified-service Karma [DESIGN GOAL]. v3.0 listed actions such as planting a tree, teaching for an hour, helping an elder, serving on a village council or cleaning a village area, with set values. These are intended examples. The council-verification workflow they require is not yet built, and no values are paid out for them today.

Ledger integrity [DESIGN GOAL]. The ledger is transparent and entry-based today. A tamper-evident design (for example a hash-chained audit trail) is planned and is not implemented. This document makes no claim about future tokenomics, rewards, or exchange value.

4.6 Zodiac-Based Elections [PILOT — one village]

Council elections are designed to occur every zodiac month, aligned with the sun's journey through twelve solar months (Aries to Pisces). In the live pilot (Rohini Sector 24, Delhi) each sign's cycle has an 8-day nomination window followed by a 14-day voting window, electing one Nayak and one Nayika.

Feature	Description
Regular	Citizens always know when the next election occurs
Predictable	The calendar is astronomical, not political
Fair	Only residents born under the current cycle's sun sign may vote, which limits bloc manipulation

Eligibility, as enforced in the pilot:

- *Voters:* residents of the pilot village, aged 5 or over, born under the cycle's sun sign.

- *Candidates:* residents of the pilot village, aged 25 to 60 (Yuvak or Vridh), born under the cycle's sun sign, with a minimum Karma score of 200, standing for the male or female seat.

Pilot status. A pilot election has been held in Rohini Sector 24, Delhi, with one council seated so far. The pilot uses simulated demo voters to test the election mechanics.

Leadership is designed to rotate with the cosmos so that no faction holds power indefinitely. Only one village has run the cycle; the design has not been tested at district level or above.

> *"Your body is made of five elements. Your soul resides in Space. Your actions are recorded in the elements."*

5. SYSTEM ARCHITECTURE

5.1 Three Ecosystem Layers

Layer	Purpose	Audience	Status
Website	Registration, public transparency, boards, daily participation, national statistics	Everyone	**[IMPLEMENTED]**
Mobile app (cross-platform, Expo / React Native)	Daily participation from a phone; a client of the website's API	Citizens	**[IN DEVELOPMENT]**
PLNN	Planetary Ledger Node Network — distributed data infrastructure	Infrastructure	**[PLANNED]**

The website is the window, open to all. The mobile app is intended to be the daily instrument; it uses the same backend, identity, geography and consent model as the website and does not reimplement them. It has not yet been released. PLNN is the long-term foundation intended to keep data sovereign and available when connectivity fails.

5.2 High-Level Architecture

Today: a single Flask application and SQLite database serve both the website and the mobile app through the same API. Members sign in with a Private ID and PIN.

Design goal: citizens would interact through village kiosks, web browsers, or native apps. Above the interface layer, the protocol would enforce governance rules (timeline separation, nested escalation, karma verification, election cycles). Below, PLNN would distribute data across nested nodes — village, tehsil, district, state, nation, planet — so that no single server owns a community's information. A trust layer would ensure ledger integrity and encrypted private data.

```
Citizen Interfaces  (Web [LIVE] · Mobile app [IN DEVELOPMENT] · Kiosk [PLANNED])
        ↓
Qumanity Protocol  (Timelines · Governance · Karma · Elections)        [IMPLEMENTED; elections PILOT]
        ↓
PLNN               (Village → Tehsil → District → State → Nation → Planet)   [PLANNED]
        ↓
Trust Layer        (Encrypted private data · Public ledgers · Audit trail)    [DESIGN GOAL]
```

5.3 Technology Stack Summary

Component	Technology (today)	Planned / design goal
Backend	Python, Flask	—
Database	SQLite	Migration to PostgreSQL
Web	Server-rendered Jinja templates, plain HTML, CSS and JavaScript; no front-end framework	—
Maps	Leaflet, OpenStreetMap data	Wider coverage
Geography data	Structured JSON master data across the eight levels	—
Mobile	Expo / React Native (iOS and Android)	Native kiosk client
Languages	English plus 12 Indian languages	—
Infrastructure	Cloud deployment, single server	Offline-capable local nodes

Detailed schemas and APIs are documented in the repository (`docs/ARCHITECTURE.md`, `docs/API.md`, `docs/DATA_MODEL.md`).

5.4 PLNN: Planetary Ledger Node Network [PLANNED]

PLNN is the proposed data-sovereignty layer — communities would own their data at the node level, not corporations or distant governments. Each geographic level would maintain a node that:

Feature	Description
Local Storage	Stores governance data for its jurisdiction
Sync	Synchronises with parent and child nodes when connected
Offline-First	Citizens act locally; data syncs when connectivity returns
Audit Trail	Preserves a public audit trail without exposing private timeline data

PLNN is not a blockchain for speculation. It is intended as infrastructure for trust — the governance equivalent of roads, electricity, and the postal system. **No part of PLNN is built yet;** the live system is a single central server.

5.5 The Q-Map [IMPLEMENTED — pilot dataset]

Q-Map is Qumanity's interactive geographical interface — a public page (`/qmap`) that renders real map data without requiring sign-in.

- The current map is a **North West Delhi pilot**: a bounded research area of roughly 25,000 mapped features (roads, buildings and hospitals), not a complete map of India or any other country.
- Roads, buildings and hospitals are independent, togglable layers, loaded from a locally stored OpenStreetMap-derived dataset rather than live external queries.
- Visible OpenStreetMap attribution is displayed, as the Open Database License requires. Qumanity does not claim ownership of the map data.
- For a signed-in member, Q-Map can also show that member's **own** GPS-based location and nearby matched map features (within a 200-metre radius). This requires explicit, recorded and versioned **consent**; a change in the consent terms requires fresh confirmation. This personal information is restricted to the member it belongs to, and raw GPS coordinates are never included in any public response.
- The public base map contains no personal data. Public visibility of the map is not access to any individual's location.

Expanding coverage beyond the pilot is a roadmap item, not a current claim.

5.6 The Crowdsourced Location System [IMPLEMENTED]

Any platform organized around real-world geography will meet places its canonical directory does not yet contain. Qumanity uses a bounded, three-layer fallback:

1. A member can register under a **provisional** location (a candidate village or tehsil not yet in the verified directory), alongside fully optional GPS observations.
2. Once a provisional location has a defined number of qualifying, genuinely present resident members (currently 24), it is promoted to **active** status **within the provisional-location system only**.
3. That is **not** the same as entering Qumanity's canonical geography file. Adding a place to the authoritative master directory, with a permanent identifier, remains a separate, human-reviewed step that the system does not perform automatically.

Geography identifiers are stable and load-bearing. They are not renumbered, reparented or deduplicated without an approved, reviewed process.

6. KEY FEATURES

Feature	Description	Status
Collective Boards	Post, vote, escalate or archive at every level	**[IMPLEMENTED]**
Dual-Key Identity	Private ID + PIN, Account ID, no email required	**[IMPLEMENTED]**
Karma ledger	Entry-based reputation record, separate from money	**[IMPLEMENTED in part]**
Qoins	Internal civic currency earned through civic activity	**[IMPLEMENTED]**
Family Tree	Visual mapping of family relationships across generations, in the Personal timeline	**[IMPLEMENTED]**
Qmail	Internal member messaging, including messages to a village council address	**[IMPLEMENTED]**; council addresses reachable at village level only
Q-Map	Public map with member-private proximity data	**[IMPLEMENTED]**, pilot dataset for North West Delhi
Crowdsourced locations	Provisional villages and tehsils, activated by resident count	**[IMPLEMENTED]**
Citizen Reports	Issue reports with a response timeline	**[IMPLEMENTED]**
Global Account	Registration for members outside the 10 Public Account countries	**[IMPLEMENTED]**
Multi-language interface	English plus 12 Indian languages	**[IMPLEMENTED]**
Zodiac-Based Elections	Monthly council elections by sun-sign cycle; Nayak and Nayika seats	**[PILOT]**, one village
Mobile app	Cross-platform client of the website API	**[IN DEVELOPMENT]**
Marketplace	Village-level commerce using Qoins, keeping value in the community (Karma is not currency)	**[PLANNED]**
Justice Module (Restorative)	Councils facilitate dialogue, restitution and community healing	**[PLANNED]**
Health & Education Services	Community health records, teaching-hour verification, service coordination	**[PLANNED]**
Offline-First Operation	Kiosks and apps work without continuous internet and sync later	**[PLANNED]**
Village Kiosks	Shared public terminals for people without smartphones	**[PLANNED]**
Biometric Authentication	Fingerprint and face login at village kiosks	**[PLANNED]**
Voice Interface	Speak concerns in any supported language; routed to the right level	**[PLANNED]**

Every feature, built or planned, shares one design principle: equal access. The intended end state is that a farmer without a smartphone can walk to a kiosk and be heard, a teacher earns recognition for every hour of instruction, and a council leader is elected by neighbours, not appointed by distant officials. Today, the first of these needs the kiosk work that is still ahead.

7. DATA PRIVACY AND ETHICS

7.1 Core Principles

Principle	Commitment	Status
Data Sovereignty	Citizens and communities own their data; Qumanity is infrastructure, not a data broker	Commitment; node-level ownership **[PLANNED]**
Minimal Collection	Only data required for governance: identity, location, verified actions	**[IMPLEMENTED]** by design
Anonymization	Aggregated statistics never reveal individual Private timeline data	**[IMPLEMENTED]** for published statistics
Consent	Personal data shared across timelines only with explicit consent; GPS and map-matching use explicit, versioned consent	**[IMPLEMENTED]**
Access	Every citizen can view the data held about them	**[PARTIAL]** — own profile and activity are visible; a full data export is not yet built
Correction	Citizens can request correction of inaccurate records	**[IMPLEMENTED]** through council-approved change requests
Erasure	Personal data removed on verified request, subject to governance audit	**[PLANNED]** — self-service deletion is not yet built

7.2 Data Classification

Class	Examples	Visibility
Private	Birth identity, wallet, messages, personal history	Member only
Personal	Family tree, social connections, personal posts	Member and chosen connections
Public	Escalated board posts, council elections	Community at present location
Governance	Election results, karma verifications	Community and audit bodies; election history is currently restricted during the pilot
Aggregated	Village statistics, demographic charts, national trends	Public (anonymized)

7.3 Ethical Safeguards

Safeguard	Description
No algorithmic bias	Elections and karma verification are rule-based, not ML-scored
No surveillance	The platform does not track behaviour for profiling or targeting
No profit from data	No advertising, no data sales, no attention harvesting
No discrimination	All genders, castes, and faiths access the same governance rights at their location

7.4 Restorative Justice Framework [PLANNED]

The proposed Justice Module follows restorative, not purely punitive, principles:

Principle	Description
Voice	Every party affected by a harm speaks
Accountability	The responsible party acknowledges the harm

Principle	Description
Restitution	Concrete action to repair damage (karma, service, community work)
Reintegration	The community supports return to good standing
Prevention	Escalated concerns inform policy at higher governance levels

This framework draws on village traditions of panchayat mediation and the Vedic principle that Dharma is restored through righteous action, not merely punishment. No justice module exists in the current system.

8. OPEN SOURCE, THE DPG STANDARD AND RESPONSIBLE USE

8.1 Open source

Qumanity is released under the GNU Affero General Public License v3.0. The website and the mobile app are separate open repositories; the app is a client of the website's API.

8.2 The DPG Standard

Qumanity is **built for the Digital Public Goods (DPG) Standard**, and the project has produced an internal evidence pack assessing itself against each of the standard's indicators (licensing, documentation, privacy and security, data integrity, and rights review).

This evidence work is internal self-assessment and preparation. It is not a claim of formal certification. Qumanity has not represented itself as having received Digital Public Goods Registry acceptance or external endorsement. Known open gaps — including member-facing data export and deletion tools, and content-moderation (report and block) mechanisms — are tracked in the project's own forward plan.

8.3 Responsible-use principles

Principles that future development, including the mobile app, is expected to preserve:

- Geography identifiers are stable and are not changed without an approved, reviewed process.
- GPS and location collection is consent-based, versioned, and never reinterpreted under a changed consent policy.
- Access to personal location data requires authentication and is scoped strictly to the member it belongs to.
- Public map data and private member data are kept clearly separate.
- OpenStreetMap attribution and licence obligations are mandatory wherever its data is shown.
- Changes to the canonical geography are controlled and reviewed, not automated or silent.
- Implementation status is reported on an evidence basis: a feature is described as implemented, partial, piloted, or planned based on what the code and tests show, not on intention.

8.4 Social impact

Qumanity's goals are design-level: making civic participation more accessible at the village level, helping communities record their own needs in a durable way, connecting local information to larger structures, and supporting transparent, traceable participation. These are intended benefits and **design goals, not measured outcomes**. No formal, external impact evaluation has been conducted.

9. IMPLEMENTATION ROADMAP

Phase	Scope	Status (November 2026)
1: Website	Public site, registration, geography, about pages, national statistics	Implemented
2: Backend	Posts, karma ledger, family tree, messaging, admin tools, core protocol	Implemented; continuing refinement
3: Dashboard	Four-timeline dashboard, elections interface, council management	Implemented; council management for the pilot village only
4: Mobile app	Cross-platform app (Expo / React Native) using the website API; later kiosk client and biometric authentication	In development (biometrics: planned)
5: Pilot	Village-level election pilot (Rohini Sector 24, Delhi) running; additional pilot villages and kiosk deployment next	One-village pilot underway
6: PLNN Nodes	Distributed nodes at state level; offline sync protocol	Planned
7: National	State-by-state expansion across India	Planned
8: Global	Continental and planetary nodes; international adoption	Planned
9: Quantum OS	Exploration of quantum-safe infrastructure and an ethical AI layer	Long-term research aspiration; no work started

Ongoing, outside the phases: wider Q-Map coverage (beyond the North West Delhi pilot, with the same sourcing and quality standards); controlled improvement of the canonical location data; and governance expansion above village level, which will be pursued only through explicit design review and dedicated implementation, not assumed to follow from the existing architecture.

Each phase builds on the last. The website establishes public trust. The backend encodes the protocol. The dashboard empowers citizens. The app extends access to phones. The pilot tests the model in real villages. PLNN nodes would distribute sovereignty. National and global scaling extend the protocol. Phase 9 is a research direction for the decades ahead, not a commitment.

10. CONCLUSION AND CALL TO ACTION

10.1 Summary of the Argument

Governance has failed at every scale — individual, local, national, global — because it is opaque, centralized, and unaccountable. Qumanity responds with a single protocol: decentralized, transparent, participatory, self-correcting, and aligned with natural cycles. It is intended to be infrastructure — the governance layer the digital age forgot.

10.2 The Vision: A World Transformed

Imagine a world where every citizen has a persistent voice; every village has a transparent ledger; every good deed is recorded and recognised; every council rotates with the cosmos; and every nation nests inside a planetary consciousness that begins at the gram sabha.

This is not utopia. It is engineering — the same way roads, electricity, and clean water are engineering. The foundation of that engineering exists today; most of the structure remains to be built.

10.3 The Path Forward

The foundation is live at qumanity.in, and a village-level pilot is underway. What remains is substantial: finishing the mobile app, building kiosks for people without smartphones, extending pilots to more villages, and earning the trust of communities. That requires more villages, more developers, more partners, and more citizens who refuse to be spectators.

10.4 Stewardship

Qumanity is developed and stewarded by its founder, Rohit Mudgal, as open-source public infrastructure. The project does not monetise citizen data, sell governance access, or claim authority over communities that adopt it.

10.5 How to Join

Who You Are	What You Can Do
Citizen / User	Register at qumanity.in; participate in your village board
Developer	Contribute to the open-source code on GitHub
Researcher	Study governance, economics, ethics, or restorative justice through the platform
Mobile Developer	Help finish the cross-platform mobile app (Expo / React Native)
Pilot Partner	Help bring a council-election pilot to your village
Administrator	Once kiosks exist, operate a village kiosk or serve as a community Agent
Philanthropist	Fund pilot deployment, kiosk hardware, or connectivity for underserved villages

10.6 Final Reflection

India gave the world the concept of Dharma — righteous order. It gave the world Democracy — rule by the people. It gave the world the verse that Qumanity carries as its north star:

> *"Vasudhaiva Kutumbakam" — The world is one family.*

Qumanity invites every citizen, on every continent, to live as though this were true — because governance, at last, could make it possible.

Qumanity — For Humanity, Harmony & Peace.

11. GLOSSARY

Term	Definition
Account ID	The identity key tied to present location; updates on relocation (called "Public ID" in v3.0)
Ashrama	The four life stages in Vedic tradition, each with distinct duties and rights
Balak	The first Ashrama — student / learning phase (ages 0–24)
Dharma	Righteous order; the moral and cosmic law governing individual and collective conduct
Karma	Action and its consequences; in Qumanity, a reputation score recorded entry by entry. It is not money
Nayak	Male elected leader of a Quantum Punch Council
Nayika	Female elected leader of a Quantum Punch Council
PLNN	Planetary Ledger Node Network — proposed distributed data infrastructure (planned)
Private ID	The identity key tied to birth location; never changes. Used with a 5-character PIN to sign in
Q-Punch	Quantum Punch — Qumanity's council-addressing and participatory-governance mechanism
QID	Qumanity Identity — the dual-key system of Private ID and Account ID
Qoins	The platform's internal civic currency, earned through civic activity
Rta	Cosmic and social order; the principle that the universe operates by discernible, righteous law
Sanyas	The fourth Ashrama — renunciation / wisdom phase (ages 75 and above)
Vasudhaiva Kutumbakam	Sanskrit: "The world is one family" — the guiding philosophy of Qumanity
Vridh	The third Ashrama — elder / advisory phase (ages 50–75)
Yuvak	The second Ashrama — householder / working phase (ages 25–49)

In the live election pilot, candidates may be Yuvak or Vridh (ages 25–60).
